

## Database Structure

These three databases are architecturally separate from day one. A practitioner can never see another practitioner's data. No individual client data is ever visible in the proprietary dataset — only anonymised aggregates. Every database field should be designed with the question: which database does this belong to and does it feed the proprietary dataset? This architecture is the foundation of Leida's long term data asset value.

The proprietary dataset is not a feature visible to practitioners. It accumulates silently as a byproduct of normal use. Every schema decision made now affects the quality and commercial value of this dataset so it must be designed deliberately from day one.
